

We will create a reconciler instance using Reconciler which accepts a host config object.

```
import Reconciler from 'react-reconciler';

const SongReconciler = Reconciler({
  createInstance(type, props) {
    // e.g. DOM renderer returns a DOM node
  },
  // ...
  supportsMutation: true, // it works by mutating nodes
  mutation: {}, // mutation operations
  appendChild(parent, child) {
    // e.g. DOM renderer would call .appendChild() here
  },
});
```

In this object we will define some methods which can be thought of as lifecycle of a renderer (**update**, **append children**, **remove children**, **commit**).

```
import reconciler from 'react-reconciler';

const SongReconciler = reconciler({
  createInstance(type, props) {
    // e.g. DOM renderer returns a DOM node
  },
  // ...
  supportsMutation: true, // it works by mutating nodes
  mutation: {}, // mutation operations
  appendChild(parent, child) {
    // e.g. DOM renderer would call .appendChild() here
  },
});
```
