Elements of Different Types

Whenever the root elements have different types, React will tear
down the old tree and build the new tree from scratch.

```
<div>                    <span>
  <PokemonCard />            <PokemonCard />
</div>                   </span>
```

Elements of The Same Type

```
<div
  className="before"
  title="noice"
/>
```
