Elements of Different Types

```
<div>
    <PokemonCard />
</div>
```

Elements of Different Types

Whenever the root elements have different types, React will tear down the old tree and build the new tree from scratch.

```
<div>                    <span>
  <PokemonCard />          <PokemonCard />
</div>                   </span>
```
